

ABSTRACT

The role of the Indonesian Automatic Fingerprint Identification System (INAFIS) Unit in the crime scene of planned murder in the jurisdiction of the Bandung Regional Police. As for the identification of problems in this paper to find out how the role of the INAFIS unit in the case of the crime scene of planned murder, then what factors are supporting and inhibiting in the case of the crime scene of the planned murder and to find out what efforts have been made in the case of the crime scene of premeditated murder in the jurisdiction of the Bandung Regional Police.

The research method used is descriptive analysis. This research was conducted by interview, observation, literature study and examining activity report data conducted by INAFIS Polrestabes Unit in Bandung.

The results showed that the INAFIS Unit in conducting the case crime scene played a role as an element of technical assistance in investigating criminal acts that are scientific (scientific Crime Investigation). In implementing the crime scene of planned murder, the INAFIS Unit has an inhibiting factor, consisting of Internal and External constraints. Internal constraints include: Lack of accuracy of officers on an object and equipment used for the case processing activities are finished. External constraints include: the lack of public knowledge about the importance of handling the crime scene, time and weather factors.

Efforts made by the INAFIS Unit to overcome obstacles in case processing activities include: providing information to the public on the importance of maintaining the crime scene in order to remain Status Quo, improving the quality of police officers, improving facilities and infrastructure to support case crime scene and increasing coordination between Officials who are members of the TCT (Quick Response Team).
